

CA2 Server-Side Development

MVC blog using Laravel

Objectives

You need to create a website with a blog using the Laravel framework. The blog can be on any theme of your choice. Your Git repository must have at least 30 commits, use branches, merging and contain detailed commit messages. You will be cloning starter code to set up your project and you are expected to develop the starter code, add features to the blog and test your application for usability issues when finished.

Deliverables

- A minimum 5 page website
- A blog with at least 5 articles
- At least 1 unique feature added to the starter code
- A git repository tracking the development of the project

Project Timeline

- Clone the blog repository to get started
- Set up GitHub to push and pull code to your Git repository
- Build the application
- Interview and assessment

Assessment Criteria

Your project will be assessed by the following criteria:

- Website layout and usability (10%)
- Use of CSS in your own custom stylesheet (20%)
- Added PHP code (30%)
- Use of migrations and database schema (20%)
- Use of Git versioning Markdown and READ.me file (20%)
